DIY little house cord light

Designed by Ohoh Deco

The inspiration to create this little house garland was found in the Brussels grand place and Brugge old buildings. I love looking at these houses and see all the architectural details that decorate the facades.

Beside the prints, you will also need a LED cord lights, a pair of scissors, a cutter and some glue.

Once you have downloaded the PDF, start to print the houses. You can print the houses on regular letter size paper. I suggest to use paper thicker than the regular plain one, bond or cardstock paper will work great.

You have 6 different house designs, distributed on two sheets, each sheet has 4 houses. So count the number on LED lights on your cord light and print as many houses as you need.

Cut following the shape, each house have two facades with flaps at each ends and a center piece with a cross mark. Use a cutter to cut out the cross mark, this will allow you to pass the LED light thought the paper house.

Fold the house following the lines. You will have two folds on each side of the cross mark, next to the house roof. You also have to fold the flaps. Put some glue on one flap and glue them together.

Pass the LED light thought the small cross opening you made on top of the house and done. Repeat to have a paper house to cover each light of your cord garland.

I let the houses black and white because I like them that way, but feel free to color them or print them on colored paper
